0.1 CONDITIONAL STATEMENTS

Before we dive into S-R-A Loop lets take a first look to IF-statemen. IF-statement allows us to execute some code when the condition is **true**. Such navigation of execution of the code is essential in programming and as such one of the fundamental structures of the field. Lets test test the bumper push-button-switch if it is working properly...

0.1.1 Tasks:

- 1. Construct the bumper of the robot with push-button-switch as is shown in this video instructions.
- 2. And connect the push-button-switch (PBSW) terminals with module RobDuino according to tbl. 1:

Table 1: Connection	of push-button-switch t	to the Robduino module.
---------------------	-------------------------	-------------------------

PBSW con.	RobDuino connectors	
No. 1	AO	
No. 2	GND	
No. 3	+5V	

3. Test the push-button-switch in the bumper with next prog. 1:

Program 1: Conditional Statements.

```
const int BUMPER_PIN
1
                                      = A0;
      const int TEST_BUMPER_LED_PIN = 3;
2
3
      void setup()
4
       {
5
        pinMode(BUMPER_PIN, INPUT);
        pinMode(TEST_BUMPER_LED_PIN, OUTPUT);
6
7
8
9
      void loop()
10
        bool bumperIsPressed = digitalRead(BUMPER_PIN);
11
12
         if ( bumperIsPressed ) digitalWrite(TEST_BUMPER_LED_PIN, HIGH);
13
```

- 2. Then... complete the program to turn OFF the LED when the bumper is not touching anything.
- 3. Next... Change IF statements into single one IF-THEN-ELSE statement.

dr. David Rihtaršič

0.1.2 Questions:

- 1. Check if the LED on the output terminal D3 is ON when the bumper is pressed.
- 2. Measure the voltage potencial at the terminal A0 when the bumper is pressed.
- 3. Explain when the curly braces {} are necessary in the if-statement.

0.1.3 Summary:

0.1.3.1 IF Statement If statement can be written in several forms. The easiest one is:

```
if (value_one) statement1;
```

In this case the variable named value_one can hold some numerical number. If value_one is **true** or greater than 0 the program will execute statement1. But this simple example is not used so often due its simplicity. We rather use it in this form:

```
if ( value_one == value_two ){
   statement1;
   statement2;
}
```

In this case value_one can be any number and the statement1 and statement2 will be executed if the value_one will be equal to value_two. These command can be expanded into IF-ELSE form:

```
if ( value_one == value_two ){
    statement1;
    statement2;
}else{
    statement3;
}
```

0.1.3.2 Condition operators Also other logical condition operators can be used:

```
• Less than: a < b
```

Less than or equal to: a <= b

• Greater than: a > b

• Greater than or equal to: a >= b

• Equal to a == b

• Not Equal to: a != b

And some more conditional statements are available in C++:

• if - to specify a block of code to be executed, if a specified condition is true

dr. David Rihtaršič

- else to specify a block of code to be executed, if the same condition is false
- else if to specify a new condition to test, if the first condition is false
- switch to specify many alternative blocks of code to be executed

0.1.4 Issues:

0.1.4.1 <++> <++>
